

# ***4FU01A LT-1 1992-96 Coolant By-Pass Kit***

Your factory unit passes coolant through the throttle body, thus produces less horsepower. This coolant by-pass kit eliminates the passing of coolant through the throttle body, which keeps incoming air temperature cooler and provides more horsepower.

Note: Colder days produce faster cars.

Install only on a cold engine!! Underneath the throttle body there are two coolant lines, (one on the bottom left and one on the bottom right of the throttle body) one comes from the radiator and the other from the intake manifold. Remove the lines that enter the throttle body and mate them together with the by-pass tube and fasten the clamps securely. Start engine and check for leaks. If there are no leaks then you are ready to go. If you have leaks, check your connection and or check clamps. If you are still having problems, please call 865-521-9100.
